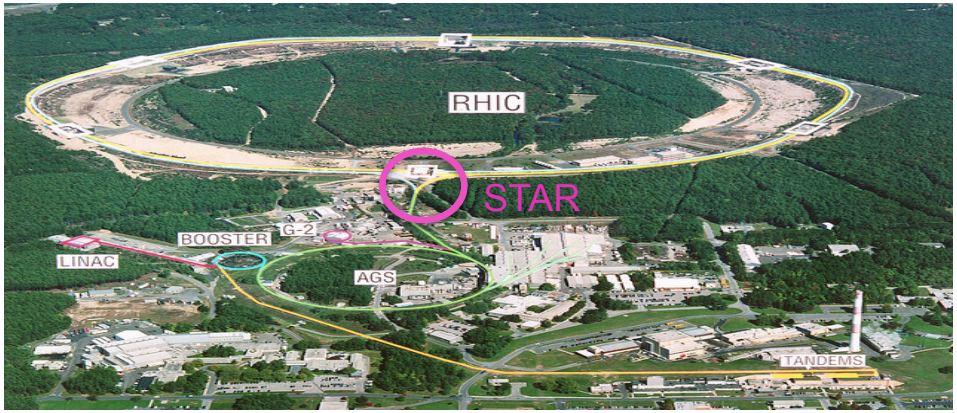
Recent results of gluon and sea quark ~~spin~~ measurements in polarized proton-proton collisions at STAR



Xuan Li for the STAR Collaboration

Temple University

Outline

- Introduction ~~to spin physics~~
- RHIC and STAR ~~aspect~~
- Selected STAR measurements
  - Gluon polarization: inclusive jet A_{LL}, di-jet A_{LL}.
  - Sea quark polarization: W A_L.
- Summary and Outlook

Proton spin ~~constitution~~

- Proton spin is carried ~~out~~ by it components (quarks and gluons).

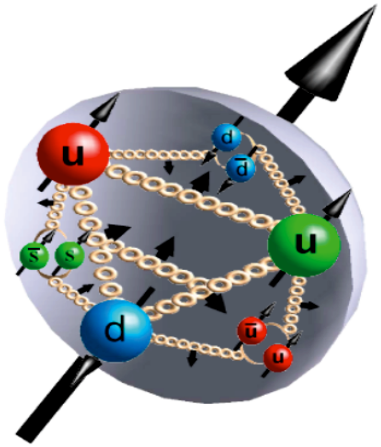
$$\frac{1}{2} = \frac{1}{2}\Delta\Sigma + L_q + \Delta G + L_g$$

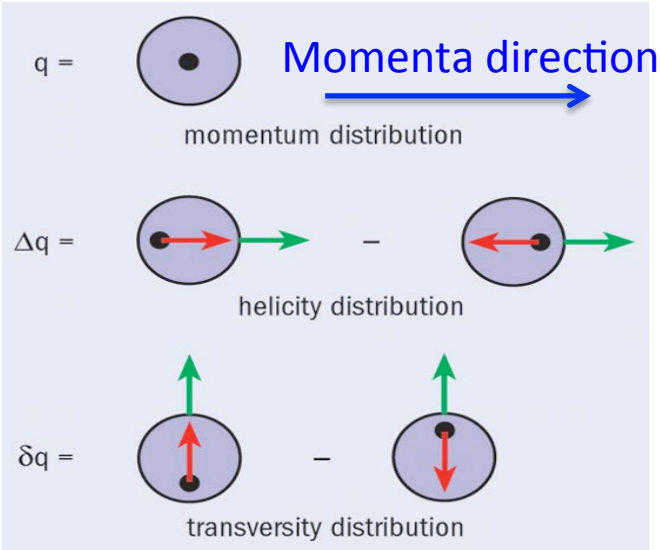
DIS measured ~30%

Little known

$$\Delta G = \int \Delta g dx$$

$$\Delta\Sigma = \int (\Delta u + \Delta d + \Delta s + \Delta\bar{u} + \Delta\bar{d} + \Delta\bar{s} + \cdots)dx$$

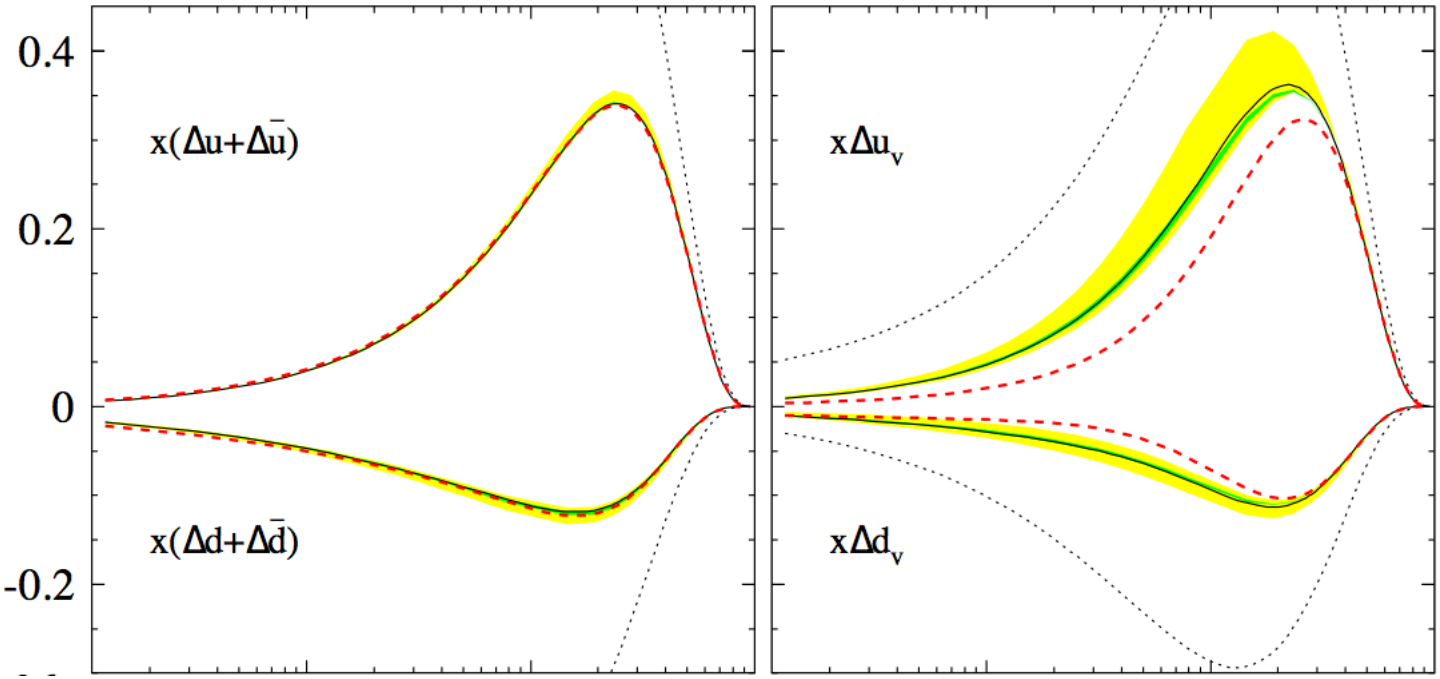




- The probability of find a parton with the same spin orientation in polarized proton is described by the polarized parton distribution function (pPDF).

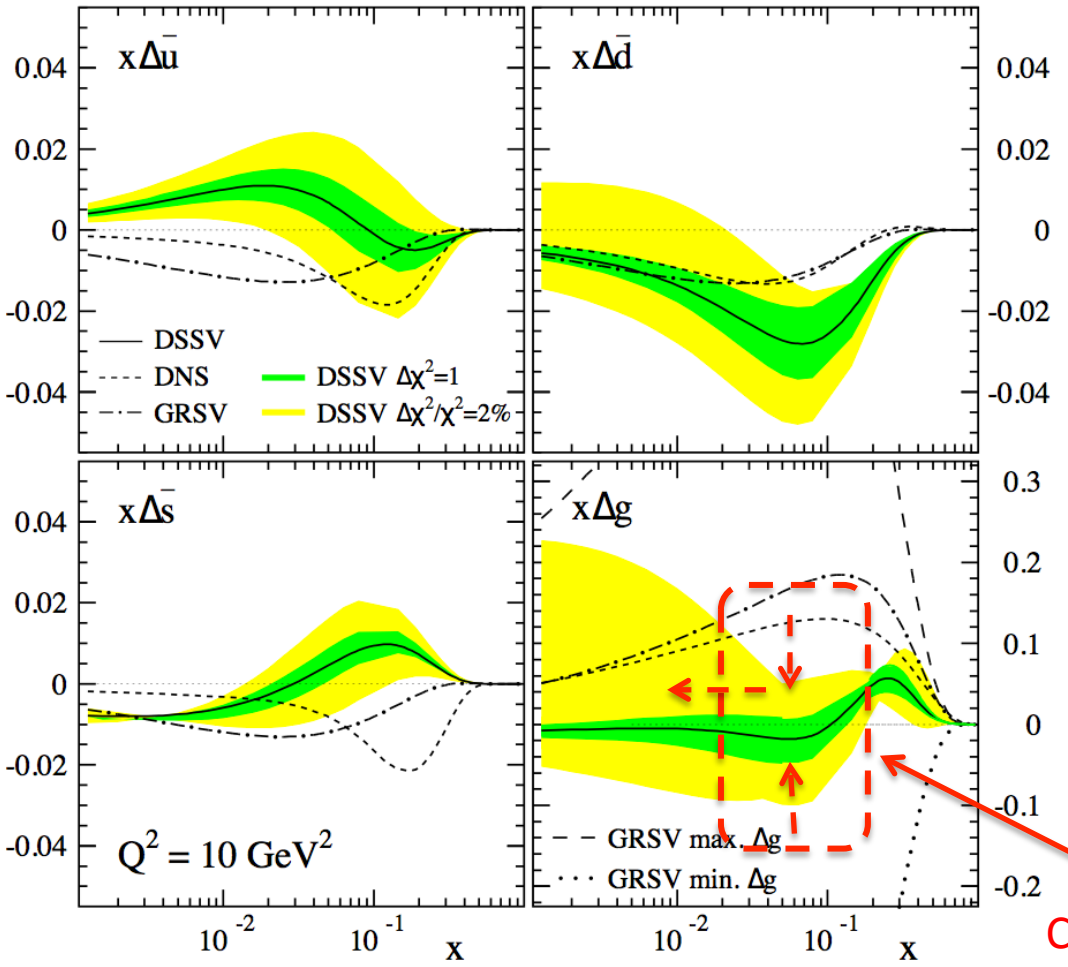
~~Status of~~ current knowledge of pPDF

- A global QCD fit (DSSV) ~~on~~ the DIS data can extract the polarization from the valence quarks ~~in~~ good precision.



D. de Florian et al., Phys. Rev. D71, 094018 (2005)

~~Status of~~ current knowledge of pPDF



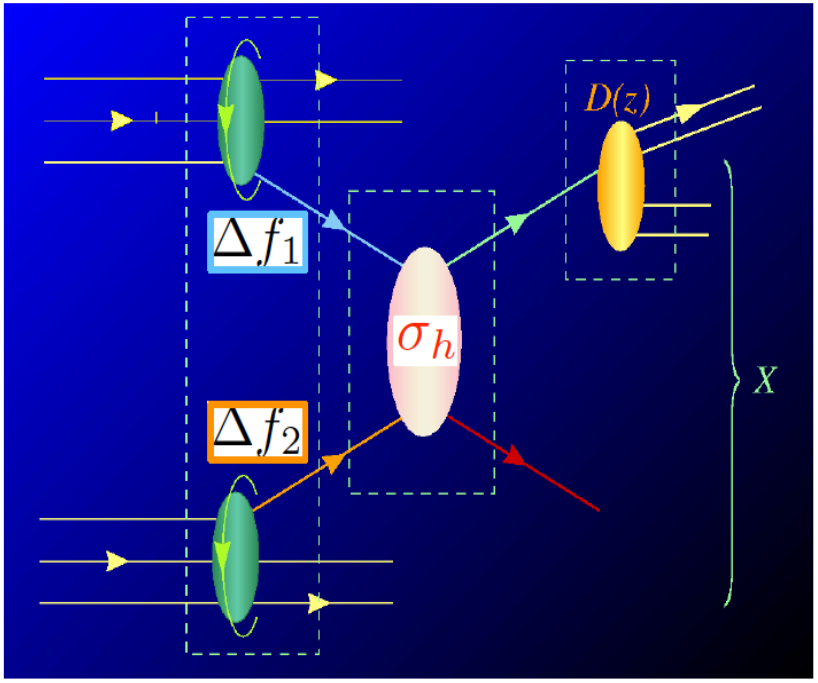
- Sea quark and gluon polarization contributions have large uncertainties.
- Data from polarized p +p collisions at RHIC will improve the precision and extend measured x region.

Current RHIC sensitive x region

D. de Florian et al., Phys. Rev. Lett. 101 (2008) 072001

How to probe parton spin contributions in p+p collisions?

- In factorization framework with the assumption of universal PDF , asymmetries of final states are proportional to the initial quarks or gluons polarization contributions.



- For example, longitudinal double-spin asymmetry A_{LL} can probe the quark or gluon helicity.

To measure

$\Delta f_{1/2}$: Quark/gluon helicity

$$A_{LL} = \frac{\sigma_{++} - \sigma_{+-}}{\sigma_{++} + \sigma_{+-}} = \frac{\Delta f_1 \otimes \Delta f_2 \otimes \sigma_h \cdot a_{LL} \otimes D_f}{\Delta f_1 \otimes \Delta f_2 \otimes \sigma_h \otimes D_f}$$

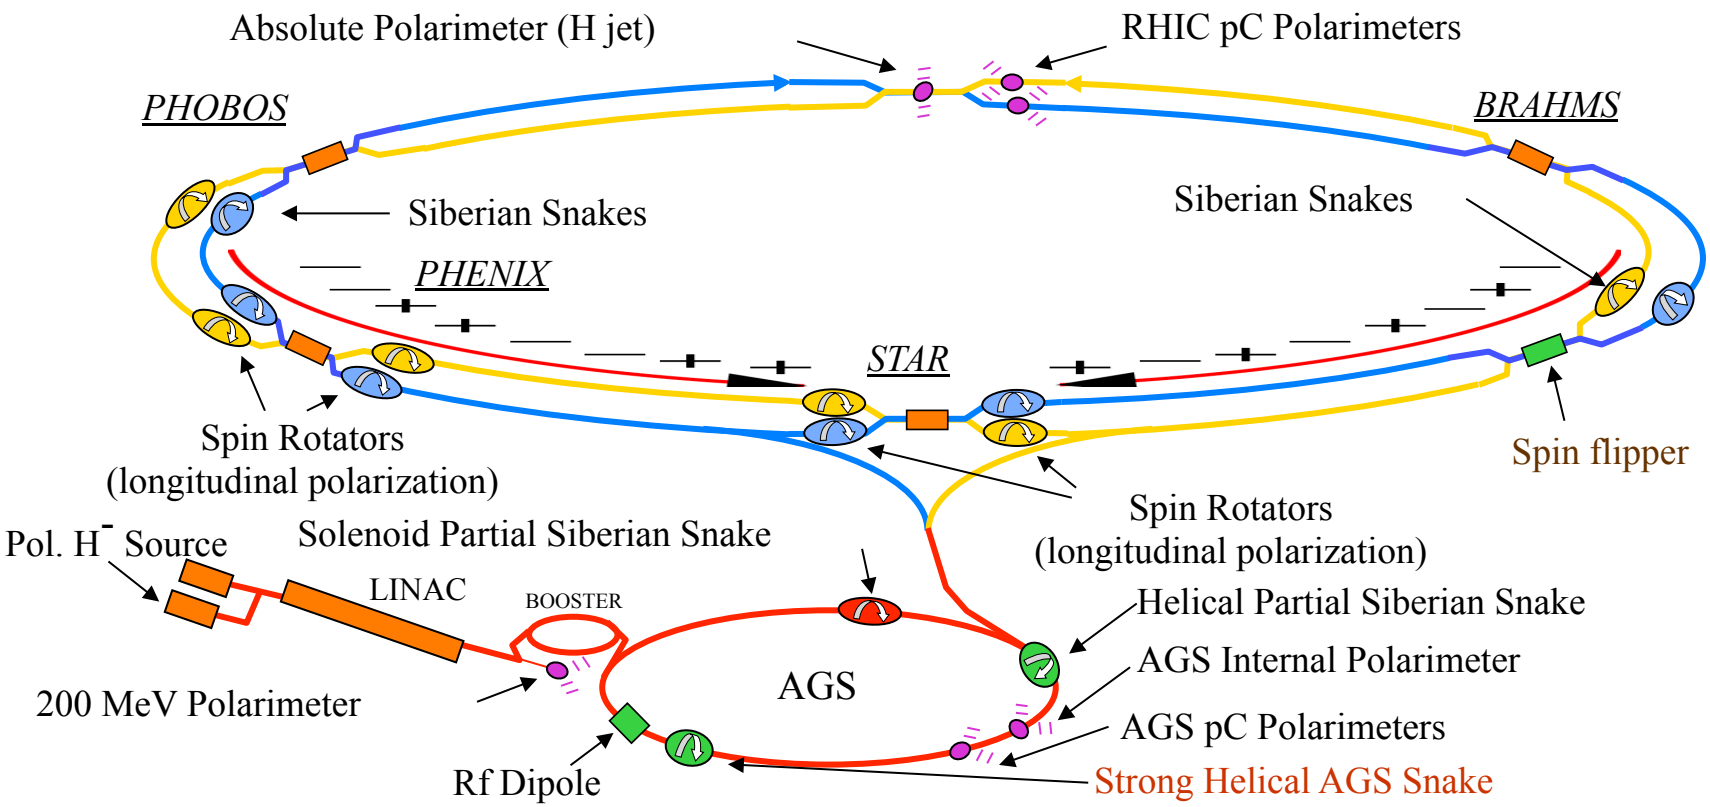
known input:

a_{LL}: polarized parton asymmetry

D_f: fragmentation function, for hadrons not jets

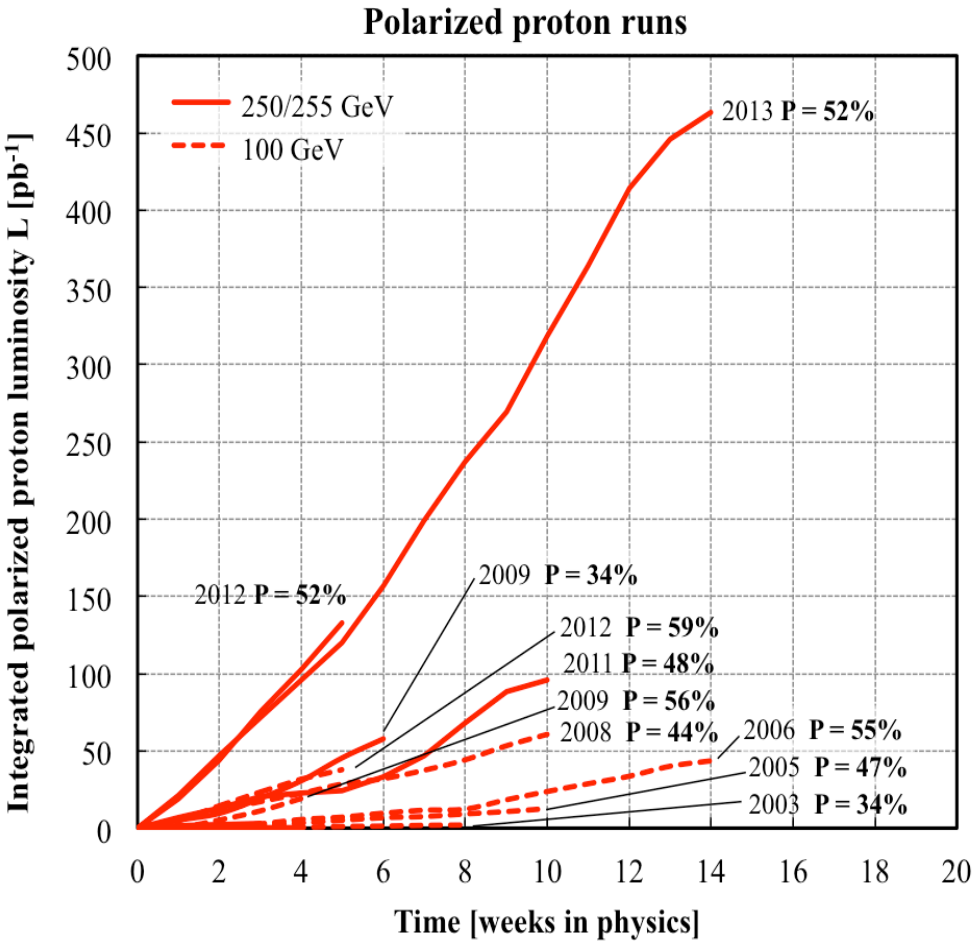
RHIC: the ~~unique~~ polarized proton-proton collider

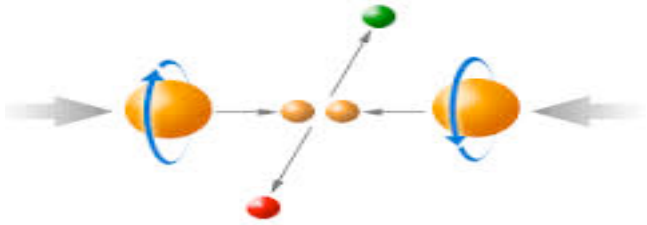
- Schematics of polarized p+p collisions at RHIC



RHIC polarized p+p collision overview

- STAR spin program ~~at RHIC is~~ exploring both the longitudinal and transverse spin ~~contributions to the~~ proton.

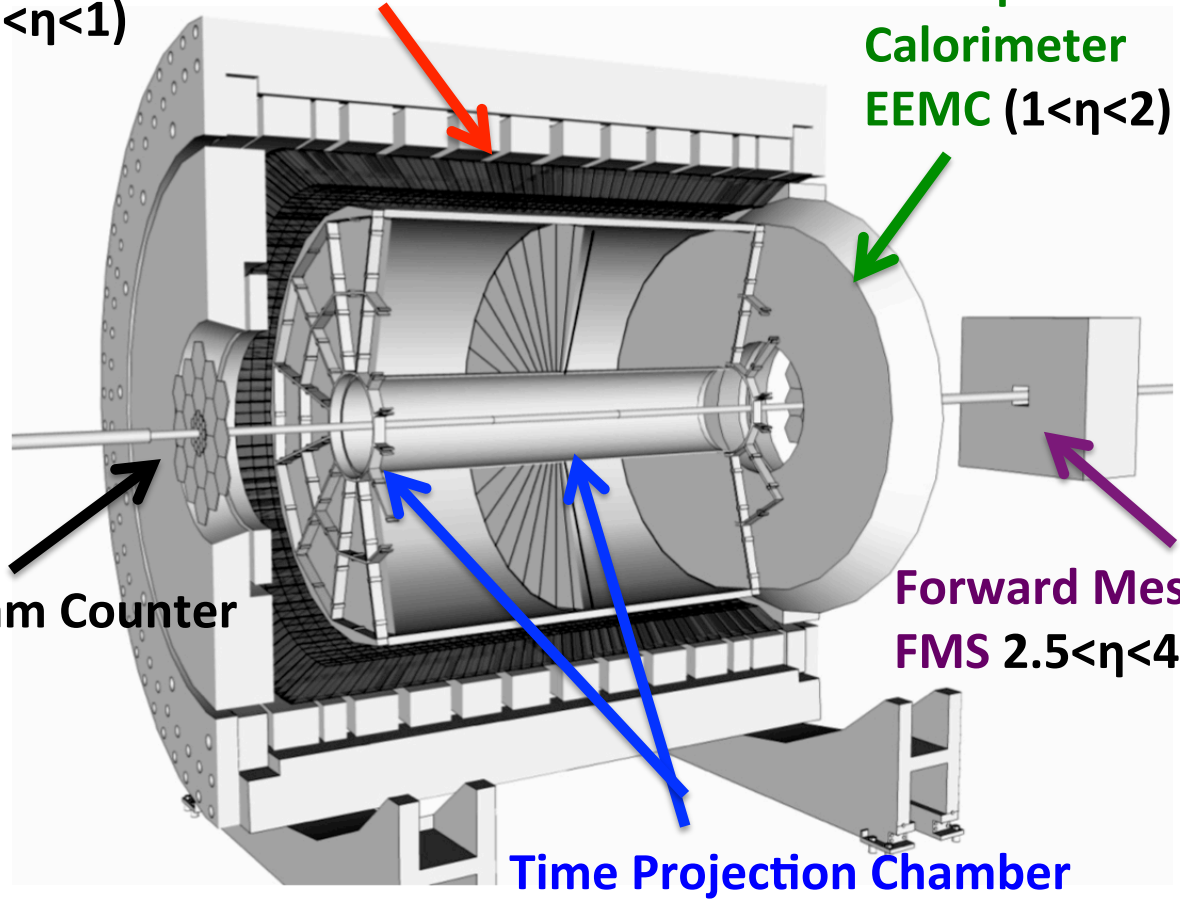




- Jet and di-jet productions in longitudinal polarized p+p collisions at √s=200/500 GeV (2009, 2012, 2013) are sensitive to the gluon polarization.
- W production in longitudinal polarized p+p collisions at √s=500 GeV (2009, 2012, 2013) can probe the sea quark polarization.

STAR Detector

- STAR has nearly full azimuthal coverage in η from -1 to 4.

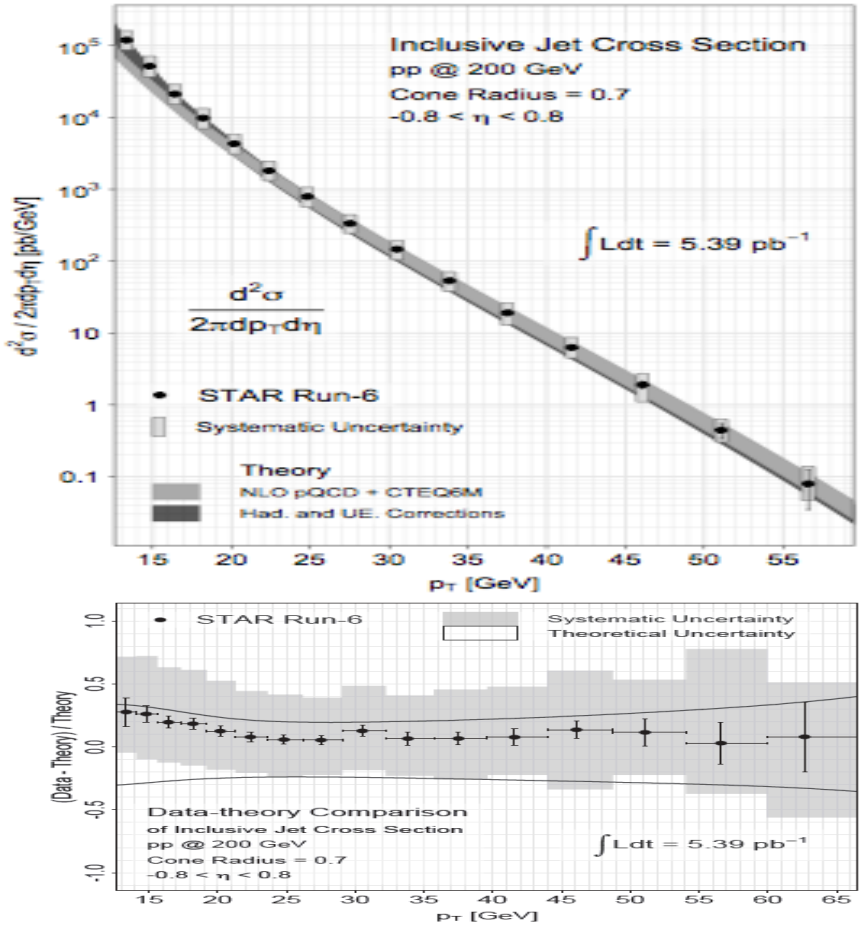


ΔG (gluon polarization) related measurements

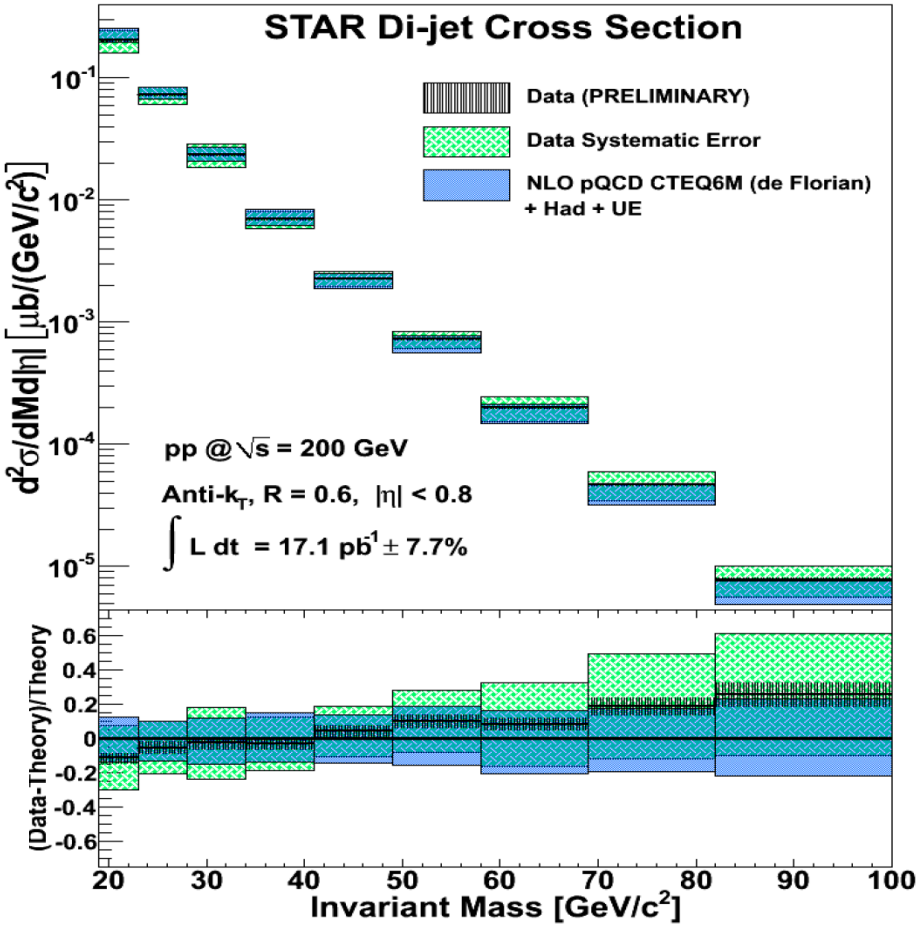
Jet cross section measurements at STAR

- Inclusive jet and di-jet cross section ~~preliminary~~ results in p+p collisions are consistent with NLO pQCD+Had+UE corrections.

Inclusive jet in p+p 200GeV



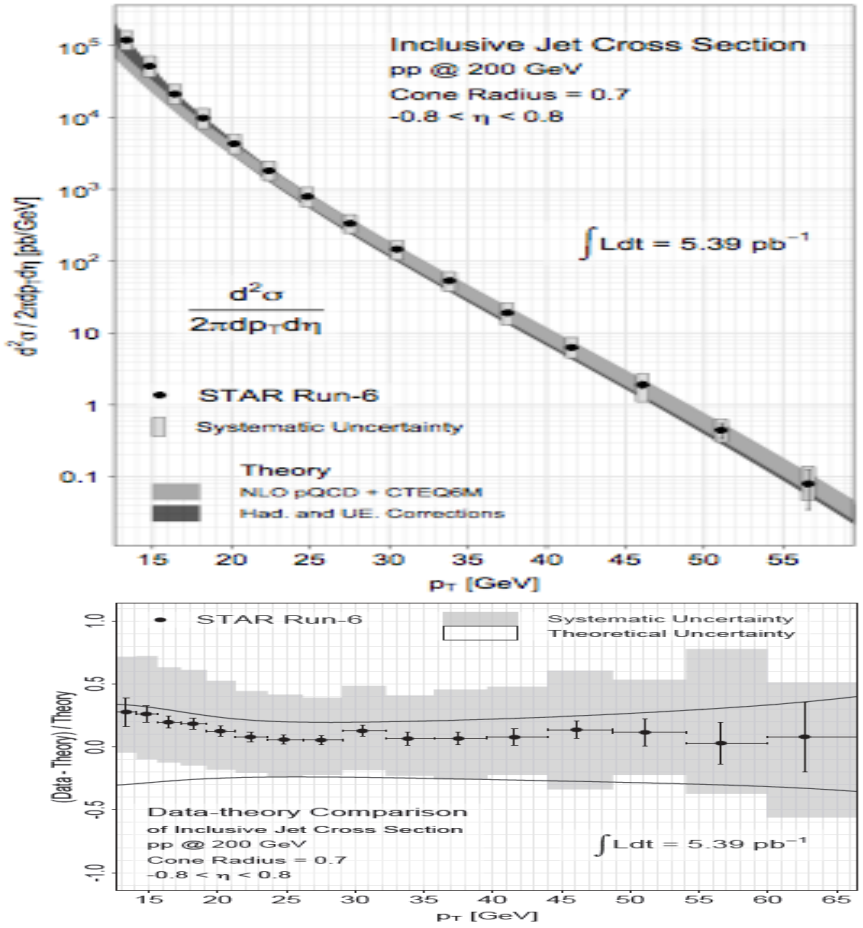
Di-jet in p+p 200GeV



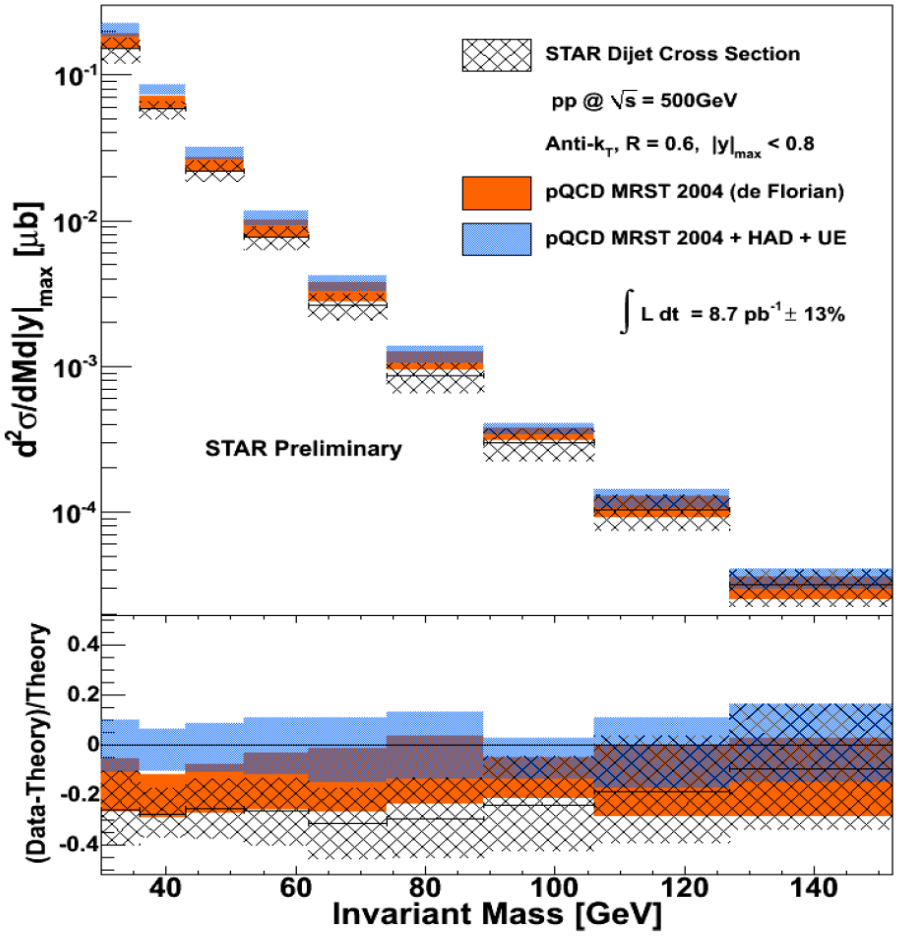
Jet cross section measurements at STAR

- Inclusive jet and di-jet cross section preliminary results in p+p collisions are consistent with NLO pQCD+Had+UE corrections.

Inclusive jet in p+p 200GeV

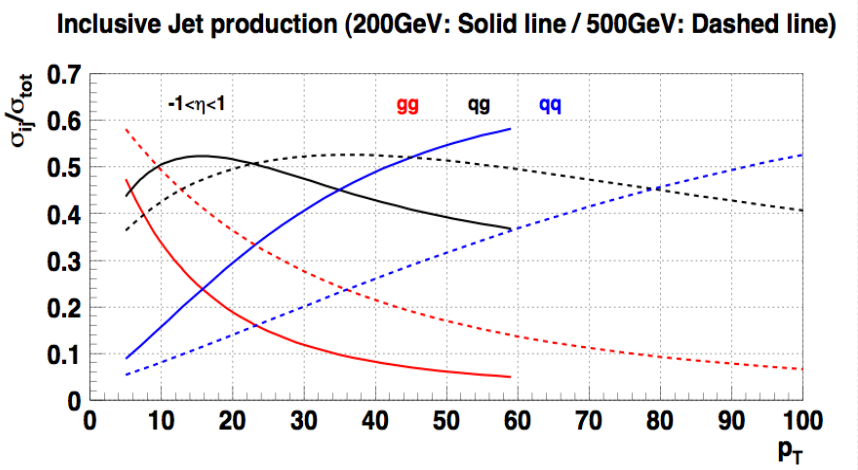


Di-jet in p+p 500GeV

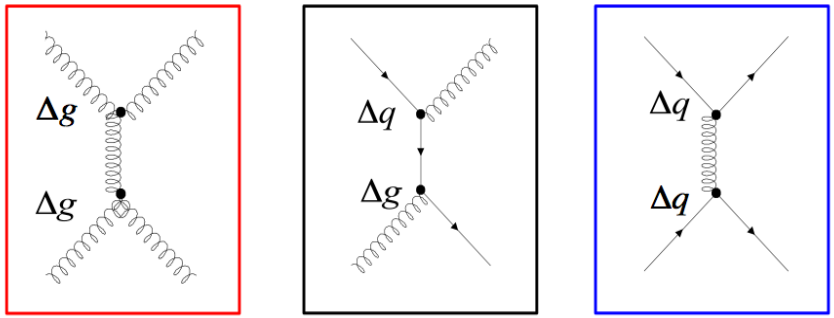


Inclusive jet A_{LL} ~~is proportional to gluon polarization~~

- Mid-rapidity inclusive jet production is dominated by g+g and q+g processes in RHIC p+p collisions.



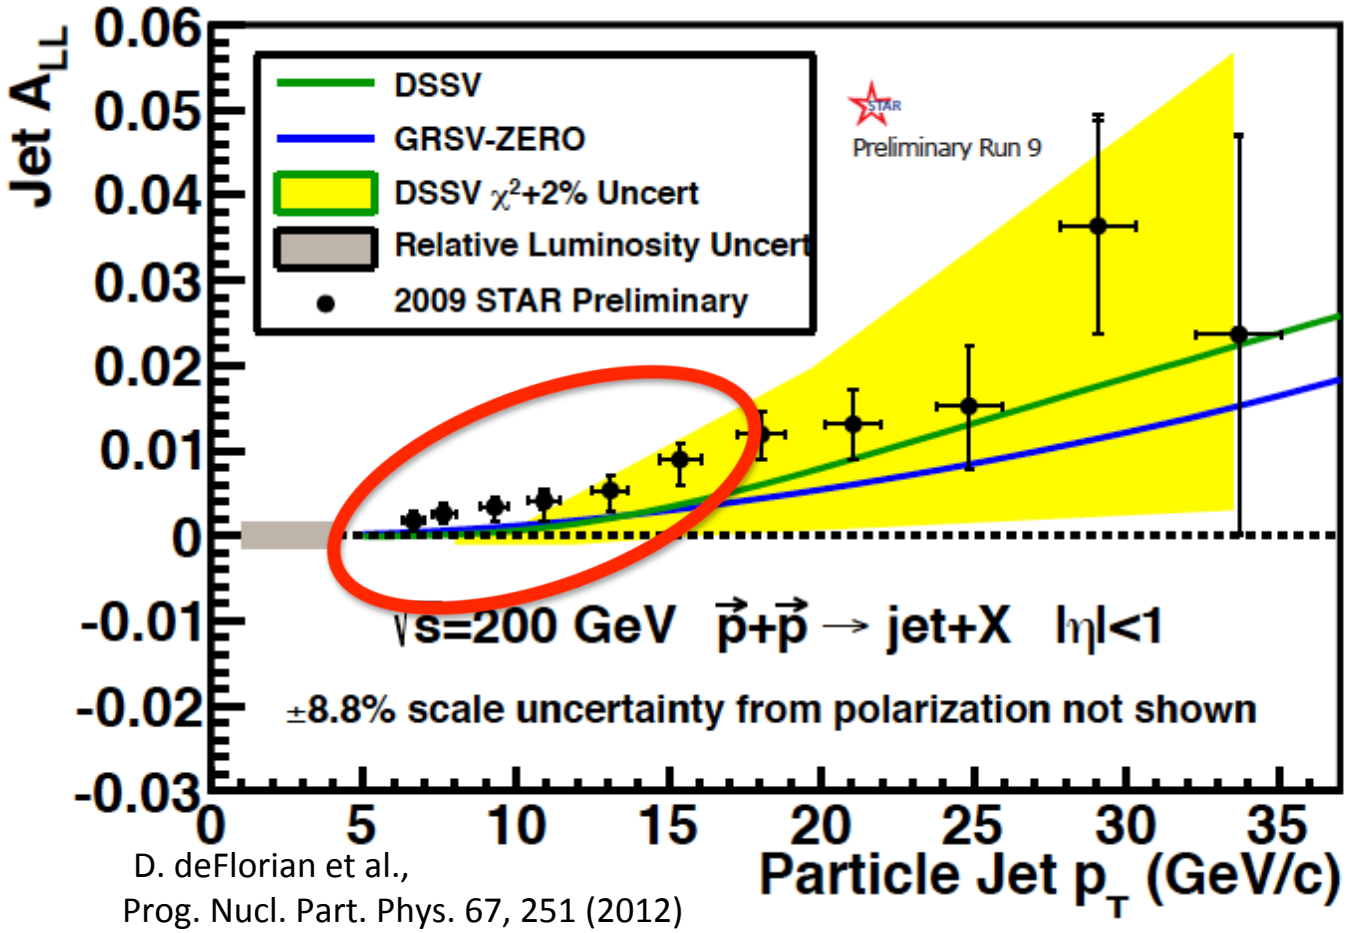
$$A_{LL} = \frac{\sigma^{++} - \sigma^{+-}}{\sigma^{++} + \sigma^{+-}} \propto \frac{\Delta f_a \Delta f_b}{f_a f_b} \hat{a}_{LL}$$



- Inclusive jet A_{LL} is sensitive to the gluon ~~polarization~~ contribution to proton.

STAR inclusive jet A_{LL} in 2009 (p+p 200GeV)

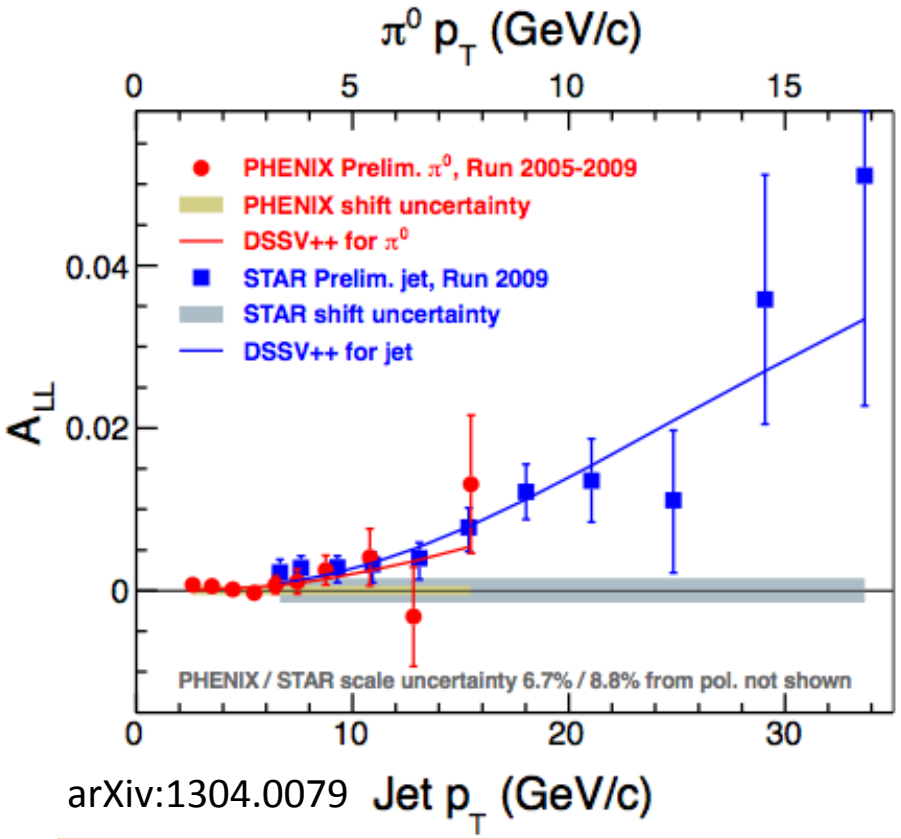
- STAR inclusive jet A_{LL} falls between DSSV and GRSV-ZERO, but larger at low p_T.



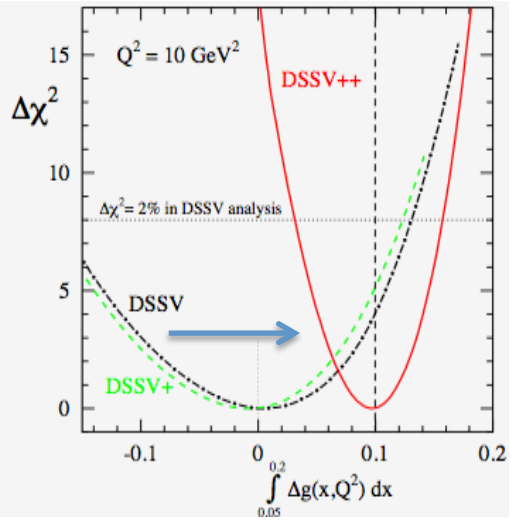
D. deFlorian et al.,
Prog. Nucl. Part. Phys. 67, 251 (2012)

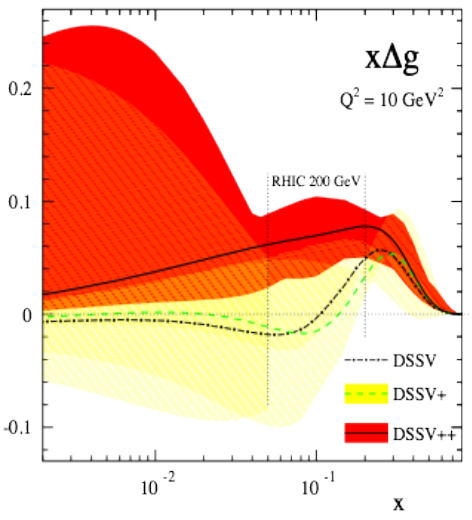
STAR inclusive jet A_{LL} in 2009 (p+p 200GeV)

- Inclusive jet A_{LL} indicates non-zero gluon polarization in $0.05<x<0.2$.



arXiv:1304.0079

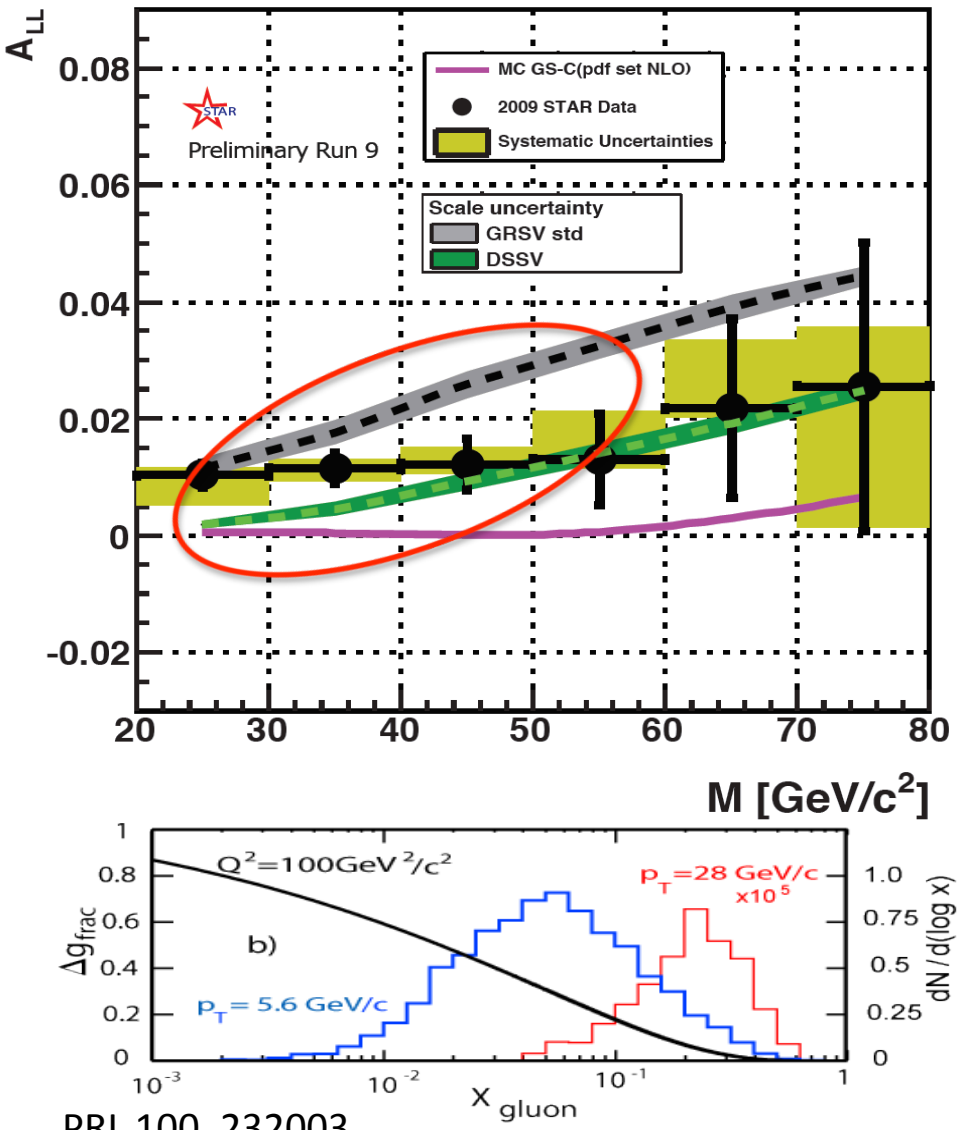




$$\int_{0.05}^{0.2} \Delta g(x, Q^2 = 10GeV^2)dx = 0.1^{+0.06}_{-0.07}$$

- STAR inclusive jet A_{LL} results narrow the uncertainties of the fitted Δg and shift the central value of ΔG.
- DSSV++ fit provides first non-zero ΔG in the RHIC sensitive region.

STAR di-jet A_{LL} in 2009 (p+p 200GeV)

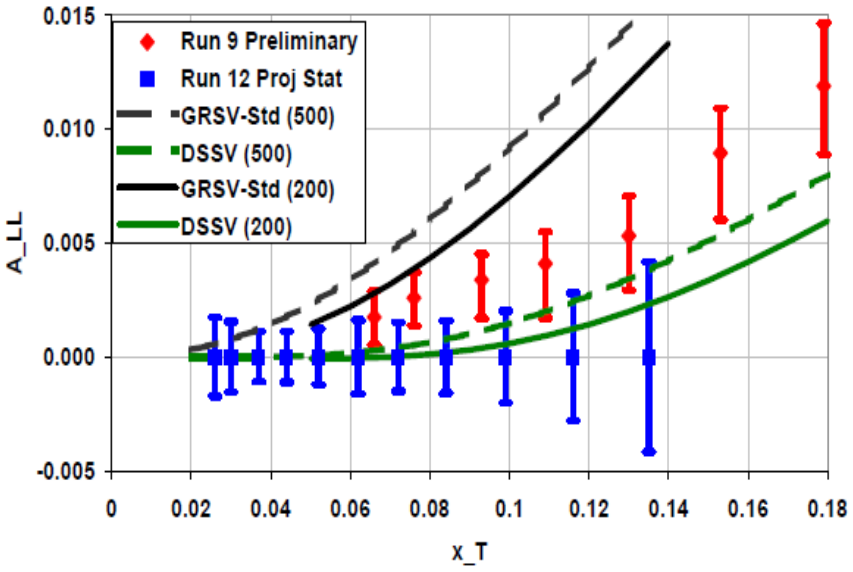


PRL 100, 232003

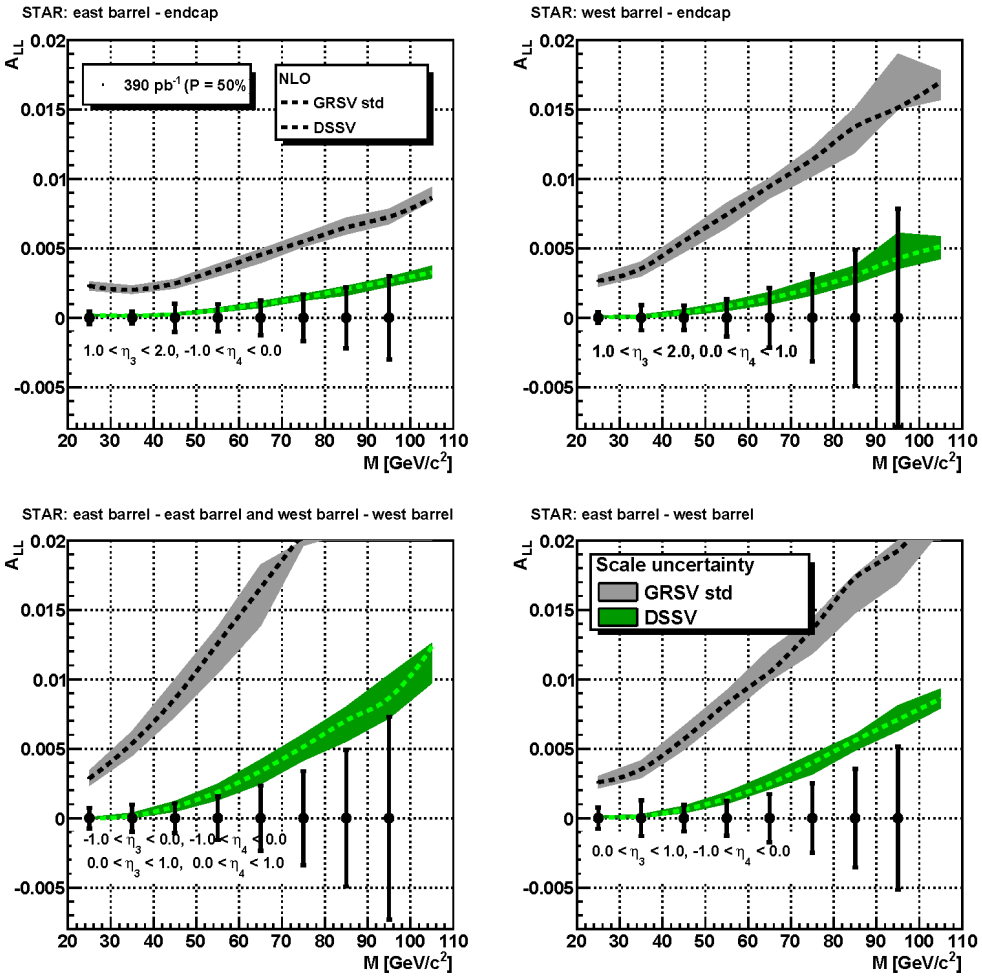
- Di-jet production constrains the probed gluon x region.
- The trend of the di-jet A_{LL} results are similar ~~like~~ the inclusive jet A_{LL} results.
- More precise results ~~can be achieved with more data taken in later runs.~~

Projections for inclusive jet and di-jet A_{LL} (p+p 500GeV)

Inclusive jet A_{LL} with P=0.5 and $L_{recorded}$=85pb^{-1}



Di-jet A_{LL} with P=0.5 and $L_{recorded}$=390pb^{-1}

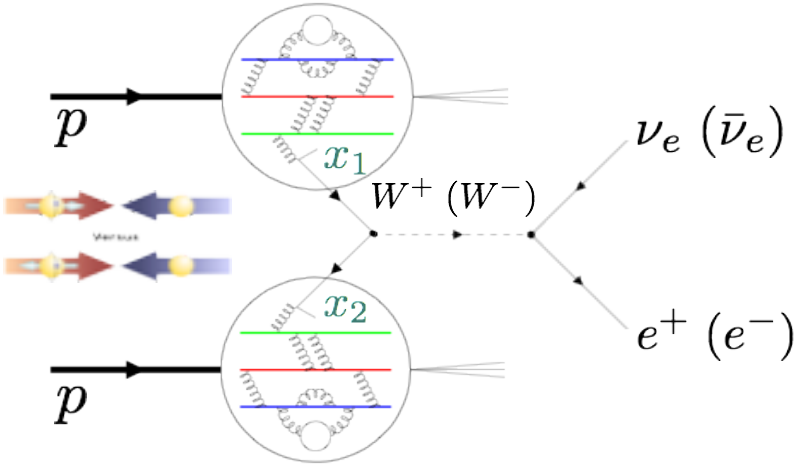


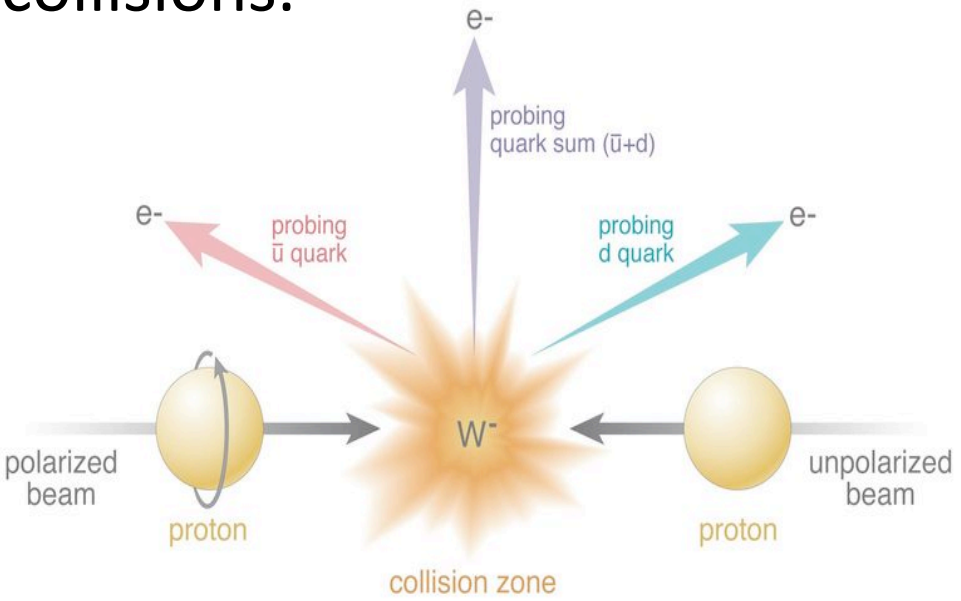
- In 2012 and 2013, RHIC has large longitudinal √s = 500GeV p+p data sample which allows us to access lower x region.

$\Delta\bar{q}$ (sea quark polarization) related measurements

W production is a direct probe for sea quark polarization

- Parity violating $W^{\pm}$ single spin asymmetry A_L probes $\Delta\bar{u}$ and $\Delta\bar{d}$ in 500GeV p+p collisions.

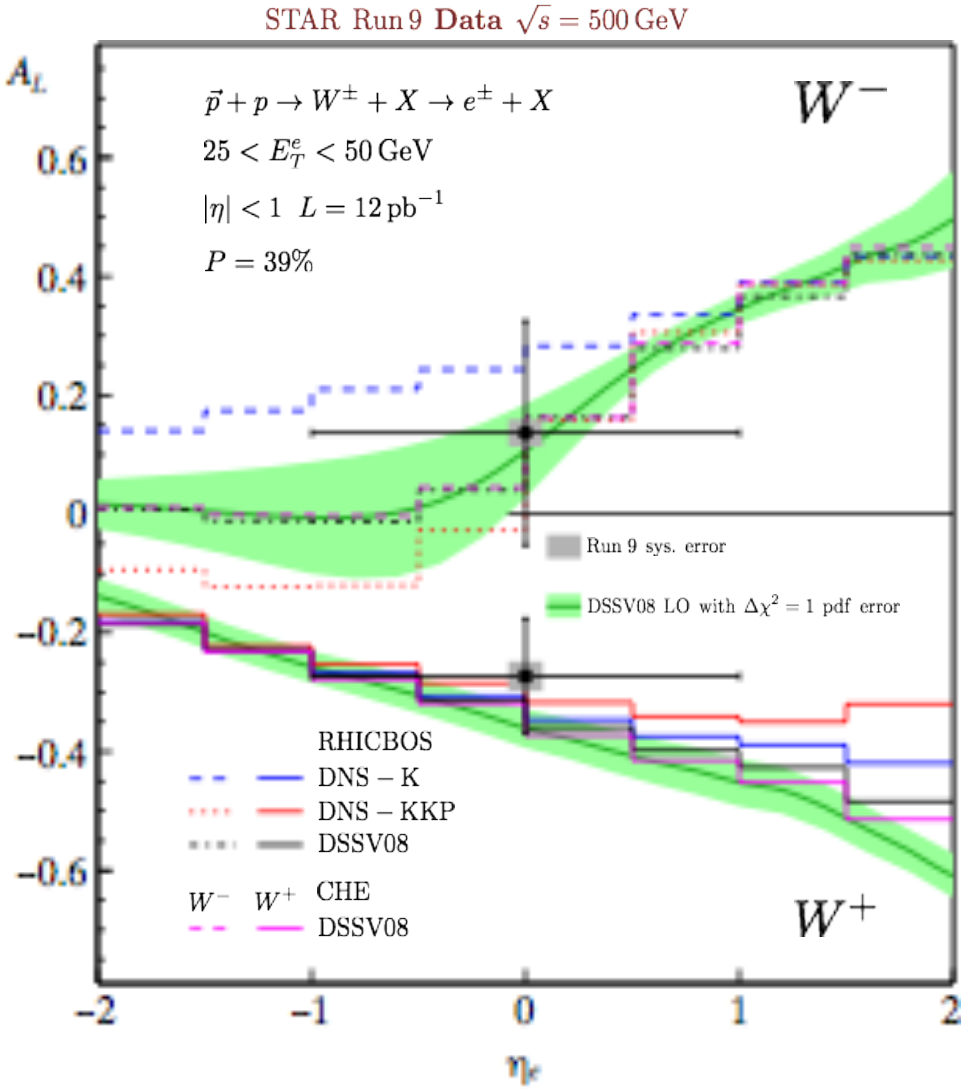




$$A_L = \frac{\sigma_+ - \sigma_-}{\sigma_+ + \sigma_-} \qquad u + \bar{d} \to W^+ \to e^+ + \nu_e \qquad \bar{u} + d \to W^- \to e^- + \bar{\nu}_e$$

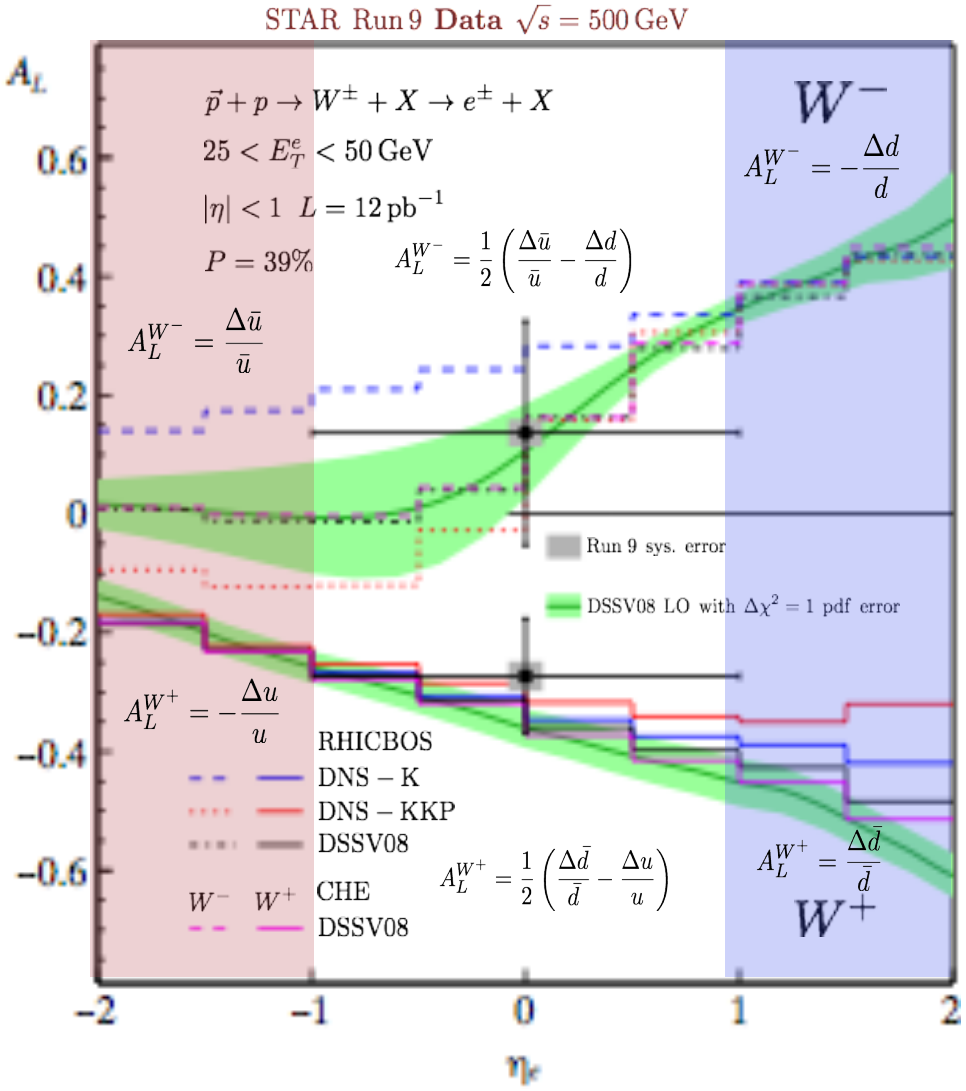
$$A_L^{W+} \propto \frac{-\Delta u(x_1)\bar{d}(x_2) + \Delta\bar{d}(x_1)u(x_2)}{u(x_1)\bar{d}(x_2) + \bar{d}(x_1)u(x_2)} \quad A_L^{W-} \propto \frac{-\Delta d(x_1)\bar{u}(x_2) + \Delta\bar{u}(x_1)d(x_2)}{d(x_1)\bar{u}(x_2) + \bar{u}(x_1)d(x_2)}$$

First W measurement at STAR



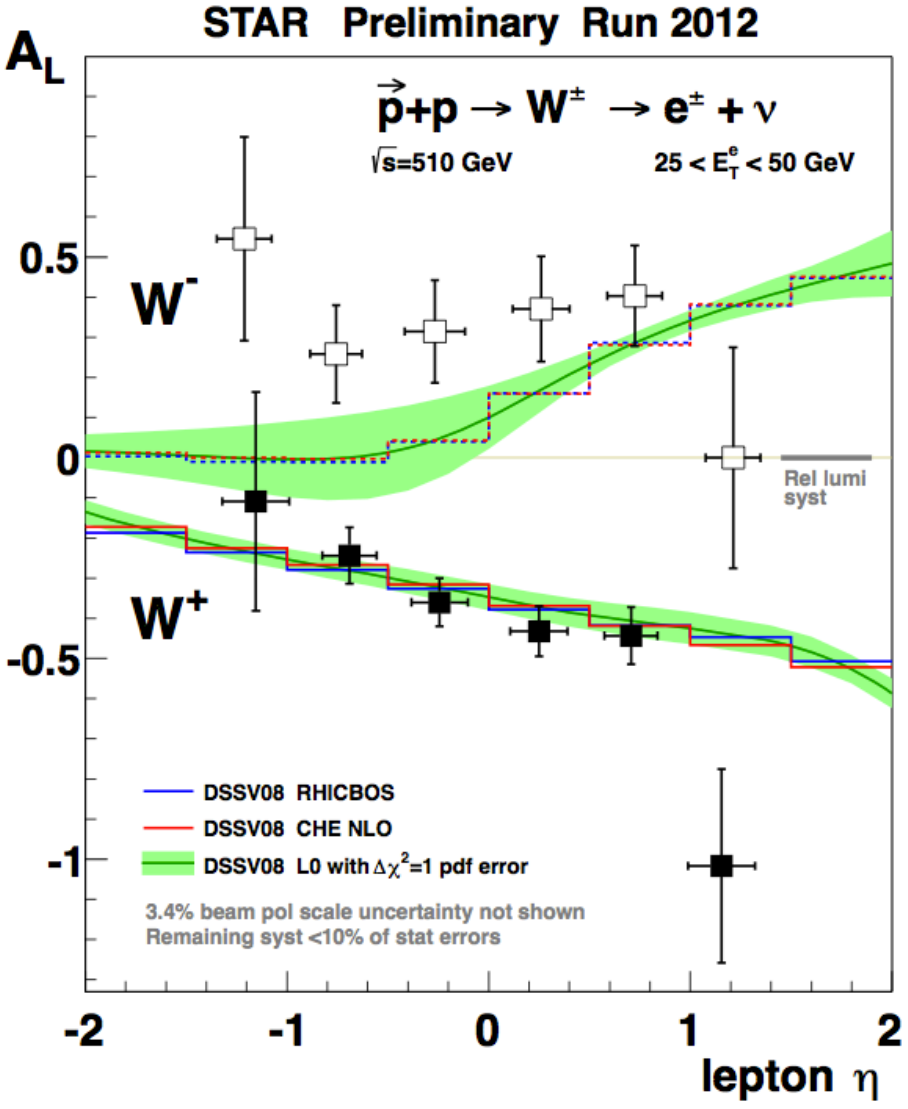
- 2009 $W^{\pm}$ asymmetries are in agreement with theory evaluations using polarized pdf's (DSSV) constrained by polarized DIS data ⇒ Universality of helicity distr. functions!

First W measurement at STAR

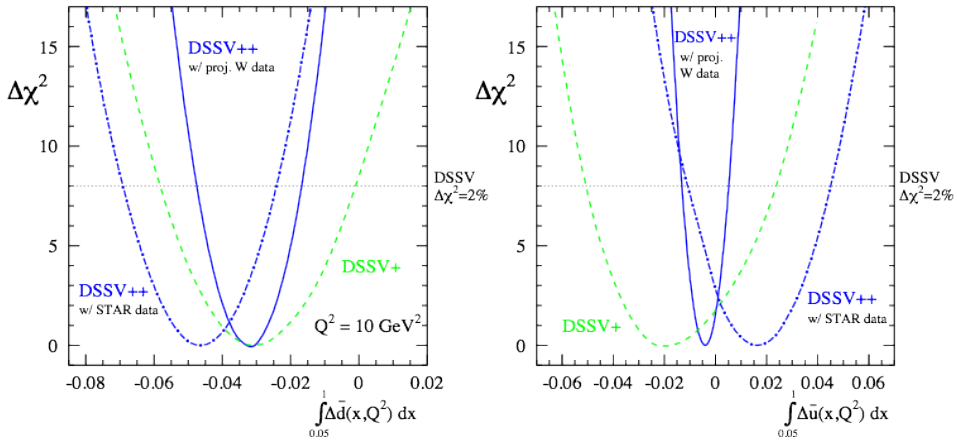


- 2009 $W^{\pm}$ asymmetries are in agreement with theory evaluations using polarized pdf's (DSSV) constrained by polarized DIS data ⇒ Universality of helicity distr. functions!
- Mid-rapidity W production probes the sum of valence quark and sea quark contributions.
- Critical to measure the W^+ and W^- asymmetries as a function η_e

First W rapidity dependent results at STAR



DSSV++ fit includes 2009 A_{LL} and 2012 A_L results

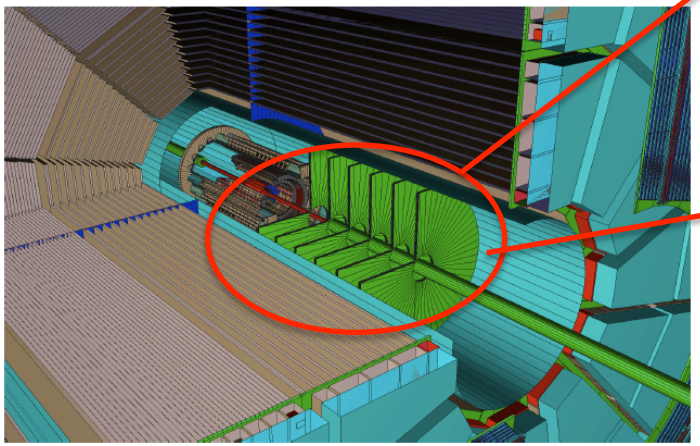


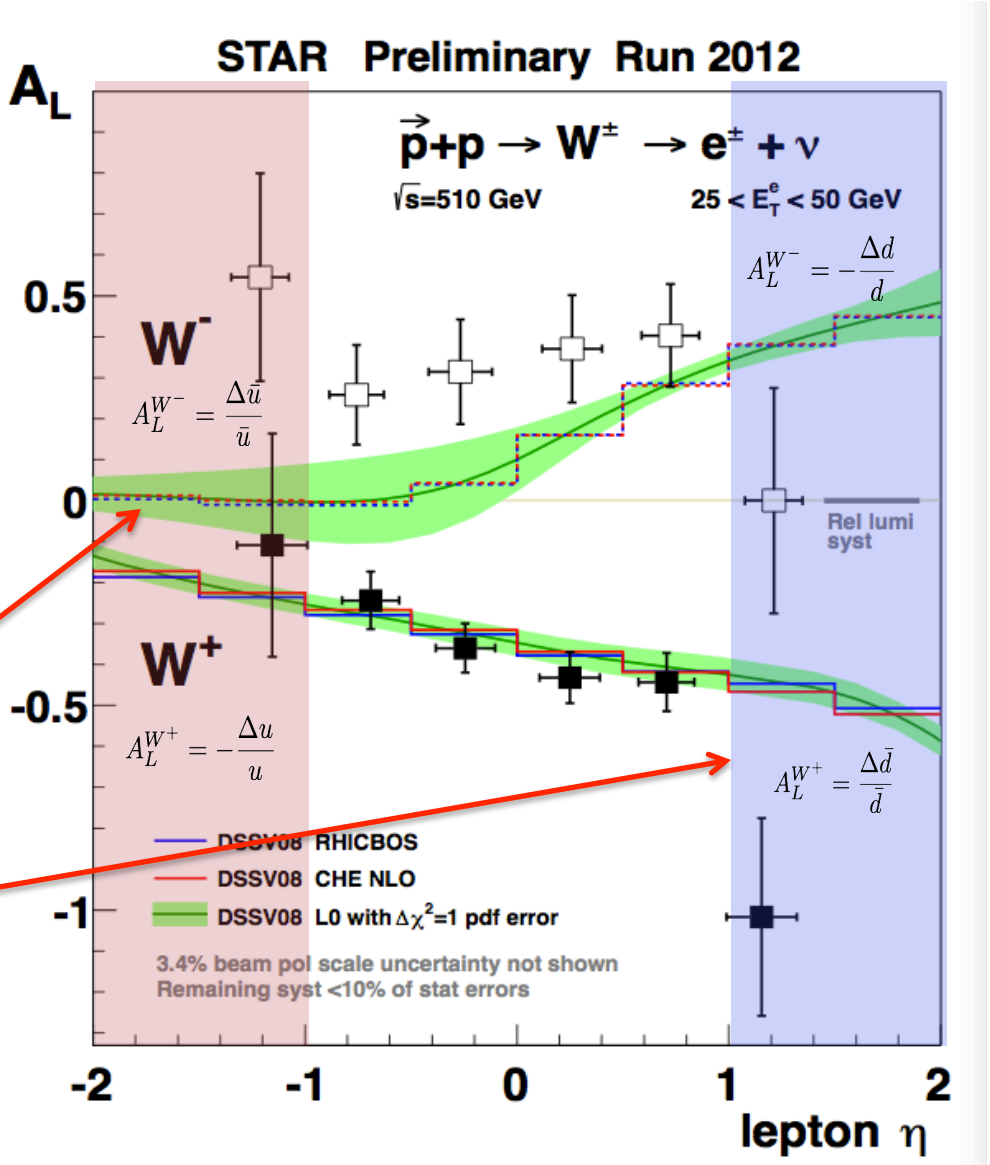
- W^- A_L is consistent with DSSV08 theory prediction.
- W+ A_L is larger than the DSSV08 prediction, the new fit (DSSV++) on the anti-u quark shifts significantly which indicates a larger anti-u quark polarization contribution to the proton spin.

Extend the rapidity to isolate sea quark contribution

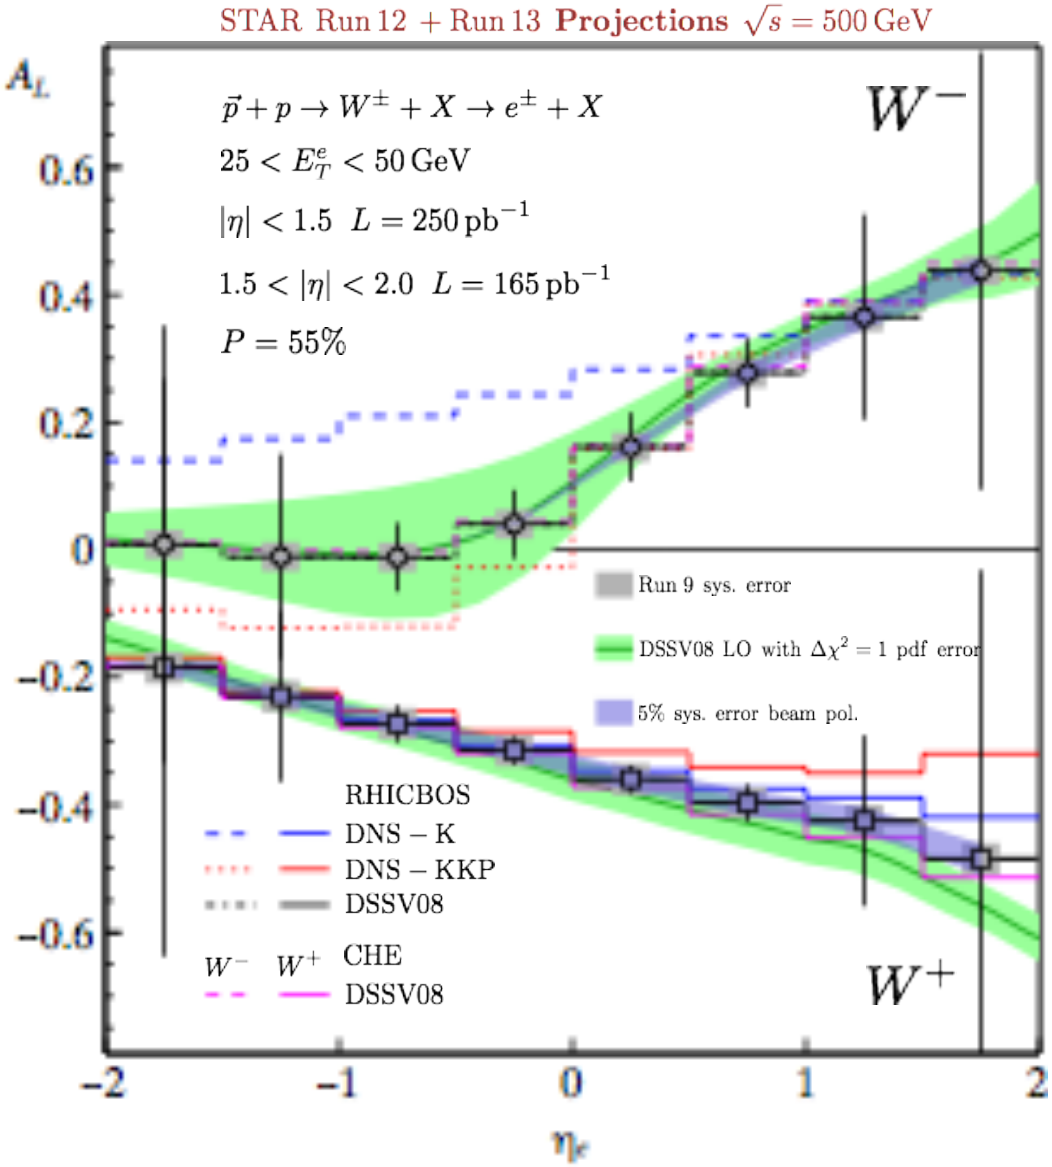
- Extension of backward / forward η_e acceptance enhances the sensitivity to anti-u / anti-d quark polarization

  ⇒ STAR Forward GEM Tracker ($1<|\eta_e|<2$) fully installed for 2013 run.

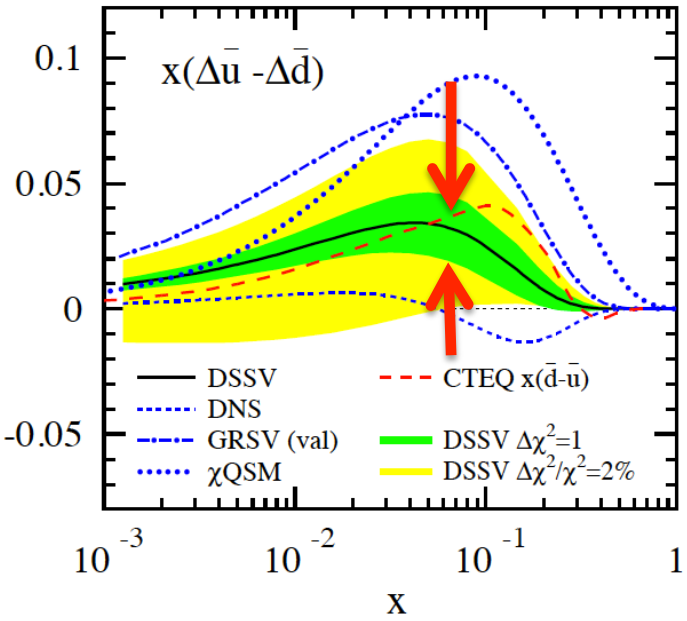




Projection of W A_L in combined 2012/2013 data



D. de Florian et al., Phys. Rev. Lett. 101 (2008) 072001



- Large data sample already collected in 2013 will further improve the constraints on the sea quark polarization.

Summary and Outlook

- Gluon polarization program:
  - 2009 inclusive jet A_{LL} measurement suggests small, non-zero ΔG.
  - 2009 di-jet measurement opens the path to constrain the shape of Δg.
- Sea quark (W boson) program:
  - Mid-rapidity: 2012 W^- A_L suggests a larger anti-u quark polarization contribution.
  - Forward/Backward rapidity: STAR FGT upgrade.
- 2012 run and future
  - Long. 500GeV runs in 2012 (~85pb^{-1}) and 2013(~310pb^{-1}) allows us to achieve higher precision measurements.
  - Longer term upgrades are planned to prepare for the transition from RHIC to an EIC.

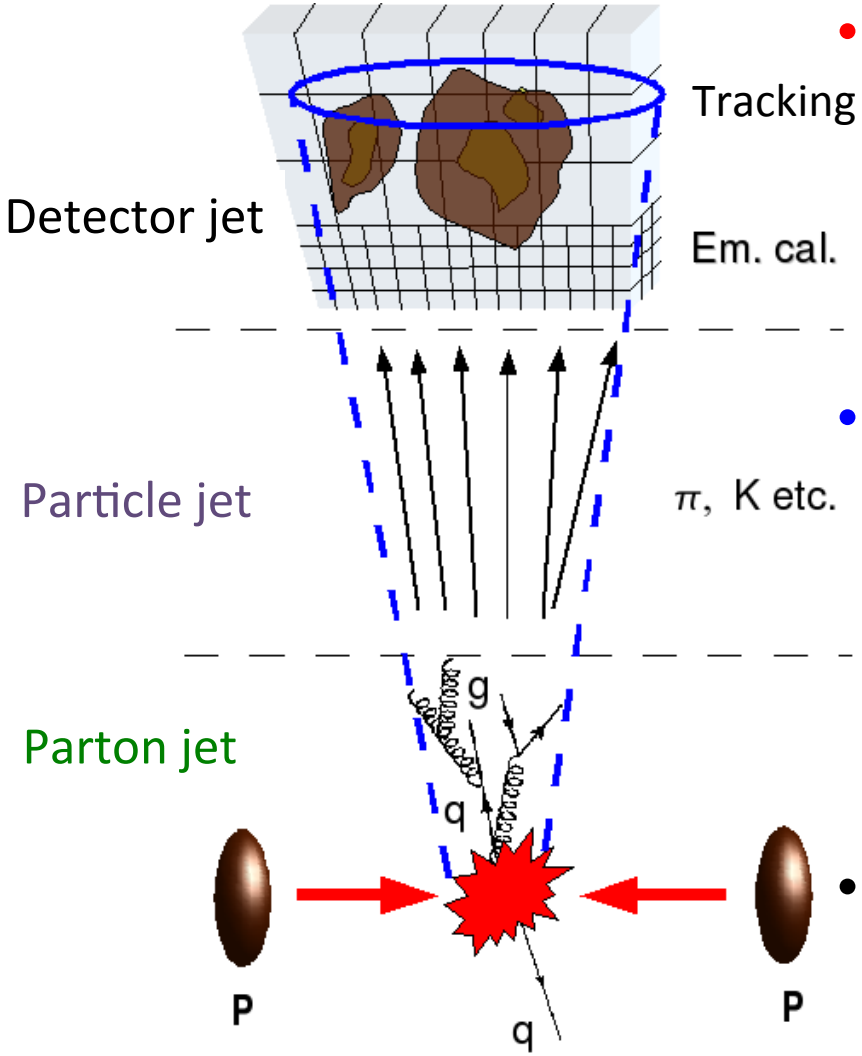
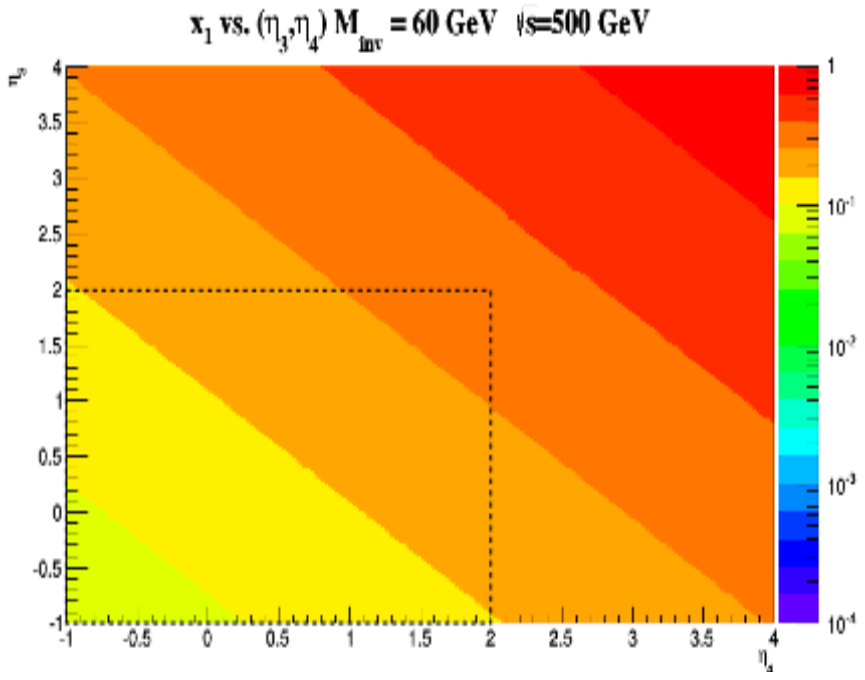
Jet Reconstruction

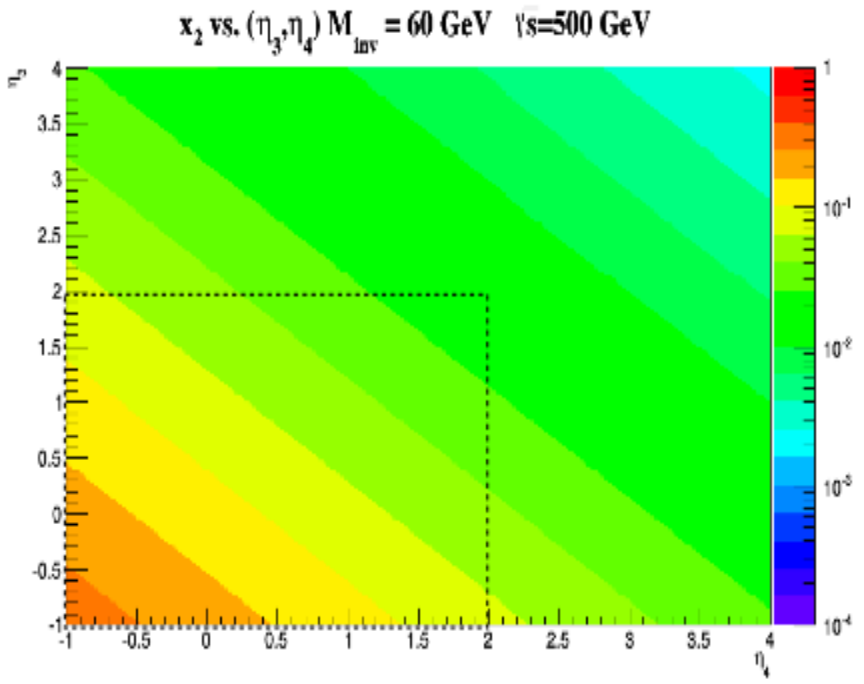


- Midpoint Cone algorithm[aXiv:hep-exp/0005012]:
  - Collect towers+tracks within a cone of radius ($R=\sqrt{\Delta\eta^2+\Delta\phi^2}$) 0.7.
  - Split/Merge fraction 0.5.
- Anti-k_T algorithm[JHEP 0804:063,2008]:
  - $d_{ij} = \min(\frac{1}{k_{T,i}^2}, \frac{1}{k_{T,j}^2}) \frac{\Delta_{ij}^2}{R^2}$ $\quad \Delta_{ij}^2 = (y_i - y_j)^2 + (\varphi_i - \varphi_j)^2$
  - Collect towers+tracks based on particle $1/k_{T,i}^2$. Select R=0.6.
  - less UE and pile up.
  - Infrared and collinear safe.
- Apply both jet algorithms on detector, particle and parton jet in data and embedding.

Di-jet kinematics in 500GeV p+p collisions

$$M = \sqrt{s}\sqrt{x_1 x_2} \qquad \eta_3 + \eta_4 = \ln \frac{x_1}{x_2}$$

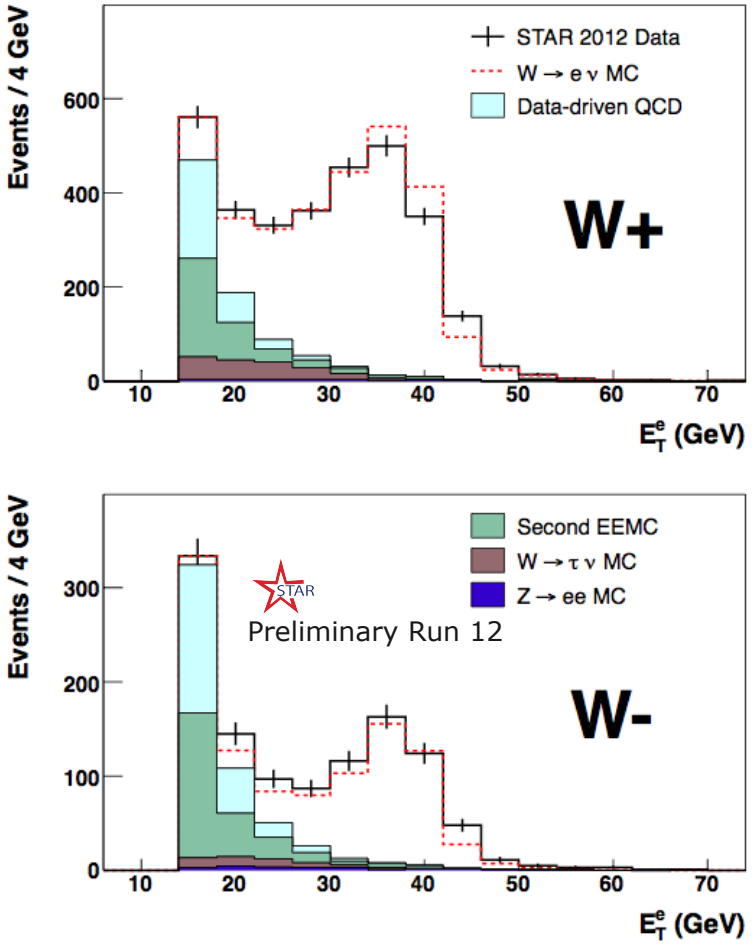




$$x_{1\,(2)} = \frac{1}{\sqrt{s}}\left(p_{T_3} e^{\eta_3(-\eta_3)} + p_{T_4} e^{\eta_4(-\eta_4)}\right)$$

W reconstruction

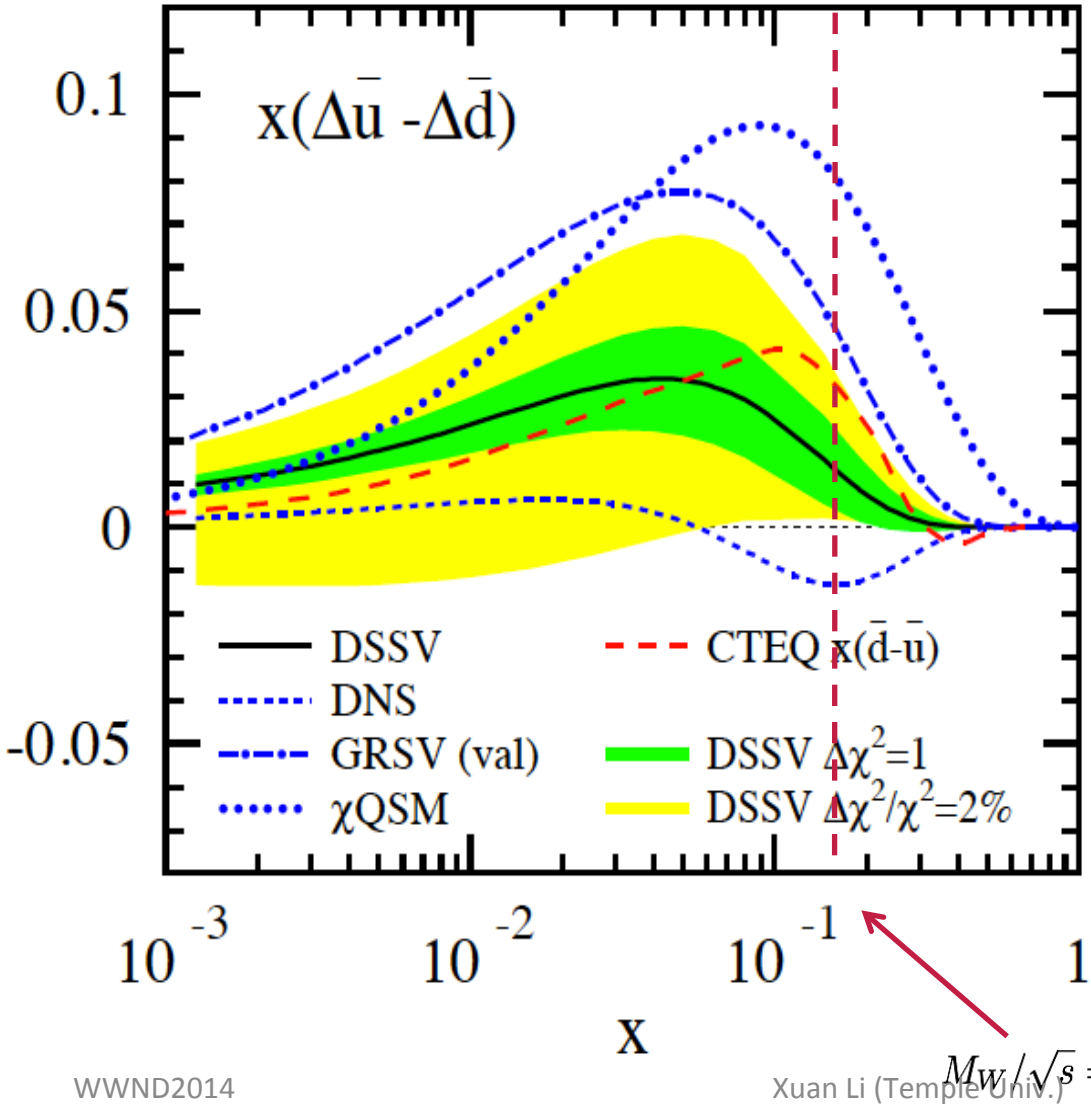
- Run12



Recent results - W production

- Impact of new DSSV result

D. de Florian et al., Phys. Rev. Lett. 101 (2008) 072001



RHIC Spin Collaboration (2012)

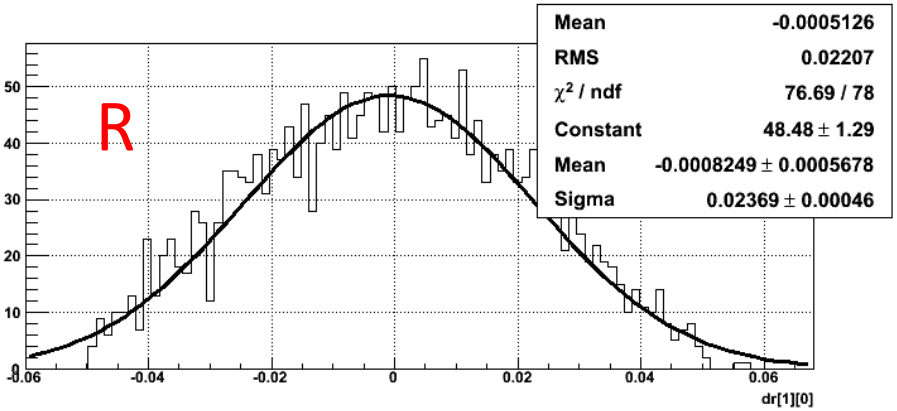
- From recent DSSV++ result incl. STAR A_L data:

$$\int_{0.05}^{1} \Delta\bar{u}(x,Q^2)dx \approx 0.02$$

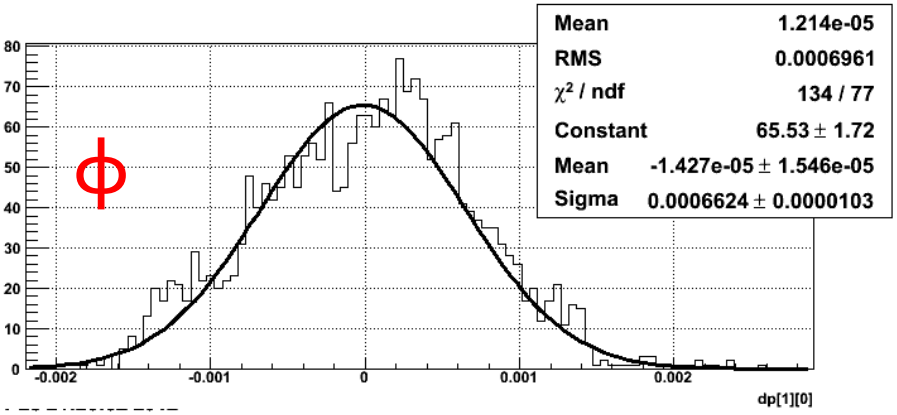
$$\int_{0.05}^{1} \Delta\bar{d}(x,Q^2)dx \approx -0.05$$

FGT cosmic ray - residual

- Use the top and bottom quadrants to determine the projected value for the middle quadrant.



Sigma = 240um



Sigma = 0.6mrad
=> 180um @ R=30cm

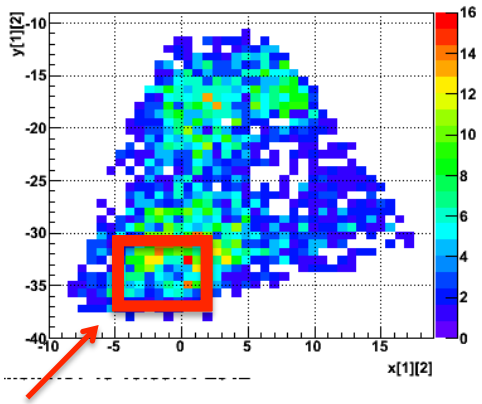
Assuming all quadrants have same resolution:
Single detector position resolution = Residual at middle quad/1.22 (from simple geometry)

180um residual @ Middle => 150um resolution at each detector

FGT cosmic ray - efficiency

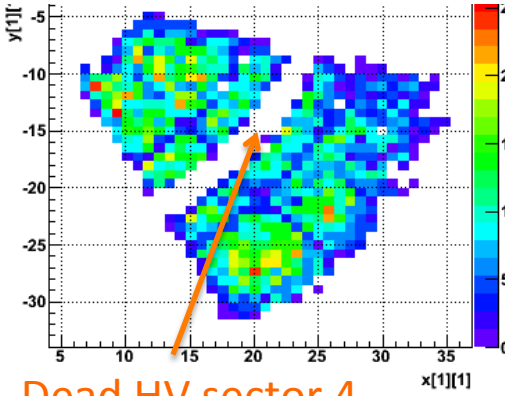
- "Good event": with clean one cluster in R&φ of two quadrants and calculate efficiency for third quadrant within good trigger area.
- Sensitive to noise at higher HV & low Threshold.

Top-Short "Golden event" Hit Map



Efficiency calculated in this area only

Middle-Long "Golden event" Hit Map



Dead HV sector 4

Reading the short octant

	Top	Middle	Bottom
3.3kV	73%	83%	81% → higher thr 76%
3.4kV	83%	88%	78% → higher thr 86%
3.5kV	87%	95%	61% → higher thr 86%

Default Thr= 4*PedRMS(~40)*3timebin ~ 500
Higher Thr = 7 * PedRMS(~40)*3timebin ~ 850

	Top	Middle	Bottom
3.4kV	72%	60%	70%

Efficiency calculated in whole octant

- Use the cosmic ray results to decide which quadrant for final installation.

Forward jet for gluon polarization
